Product Overview

The Acra Screed Base Block Ground System, is an Adjustable Screed Rail system to assist in the accurate placement of concrete to defined levels and is suitable for level and multiple cross fall applications. The strength and stability of the system accommodates power screeds.

One unit is made up of 4 Components.

Component 1 - The Base Block

A dual purpose system, the Base Block acts as the Screed Rail support foundation and bottom rebar support. The E shape of the Base Block allows it to be turned at 90 degree intervals in order to give 4 different cover heights for the rebar:
Base Block dimensions

The Base Block as can be seen in the images above, has an insert hole in each of its 4 sides. This is to accommodate the Stud Connector, from which the Rail support is threaded into.

Component 2 - The Stud Connector

The Base Block as can be seen in the images above, has an insert hole in each of its 4 sides. This is to accommodate the Stud Connector, from which the Rail support is threaded into.

Stud Connector: See Material Spec section.
Component 3 - The Rail Support

Rail Support Head Variations

The New Rail Support heads - Single and Double heads are connected to a round stud connector. The benefits of this new system is that any length of 10mm Stud can now be connected into the Rail Support, which in turn gives the user greater flexibility and no unnecessary waste.

The New Rail Support heads are only suitable for slabs of 200mm in depth upwards.

The Rail Support examples given above accommodate 8mm x 40mm and 8mm x 50mm Rail. A further head is available to accommodate a 12mm x 30mm Rail when required. Please note that the 12mm Rail supports are made to order.

The Rail Support will give an adjustment range, in general of 50mm, 25mm either side of finished level. This can then be tweaked to within half a millimetre of the required level.

When using the Base Block System the minimum concrete depth is 90mm, the maximum depth supplied to date was 1.6 metres, using a hand tamp.

The Double rail support is used where two lengths of rail meet - the rail comes in standard lengths of 6 metres, therefore a Double rail Support is required every 6 metres.
Component 4 - The Rail

Rail Sizes

The Rail is placed into the rail support

Rail variations given above. The Rail is reusable. Above photograph gives example of a rail been moved during concrete pour to new position into pre set Rail Supports.

Rail Supports for 8mm Rail carried as standard stock.

Rail Supports for 12mm Rail manufactured to order.
**Installation Recommendations**

Acra Screed recommends that one unit is positioned every meter along the screed rail line. To make the concrete pour comfortable for those laying the concrete, Acra Screed recommends positioning the Screed Rail - 400mm less than the power screed or hand tamp to be used.

For example a 4.2 meter Roller Striker - screed rail positioned every 3.8 meters apart, allowing 200mm overhang either side of the screed rail.

On the home page of the Acra Screed web site www.acrascreed.com there are two videos. The bottom video shows the Acra Screed system been set up, the top video shows a concrete pour. Watching this video is highly recommended for those new to the product.

As Standard, a set up information sheet is supplied with all orders. The system is very straightforward and easy to set up, as can be seen in the videos.

Acra Screed offer exceptional back up and technical support should you have any questions.
